

New CHIS Reporting Suite and Available Ad-Hoc Report Breakdown

As part of East of England CHIS's commitment to the Immunisation Uptake Initiative for under 5yr old vaccinations we have produced a number of routine reports and on-request reports that can be used to help give greater insight into vaccination performance or failsafe to immunisation appointment scheduling. Below is a breakdown of some of the reports that are sometimes referred to in emails, and what their rough timings are – alongside what sort of actions you can take with them.

Waiting Lists

Sent at the start of each month if one has generated for your practice, these are for Information only. They represent those patients who've not been able to be sent a letter as your clinic capacity has been met – the action for practices is to send any required clinic adjustments or queries to Child Health. This report is part of the replacement to the old "Suspension Reports" and now acts as part of the routine notification to the Call/Recall Project.

2.5yr Old Declines Report

Sent in the middle of each month to avoid confusion with the Waiting List, those surgeries who have active patients on the "Decline Pathway" may receive this report. These reports are an alert for practices of any child with a suspension or decline for their immunisations now reaching 2yr 6mths of age during that month, as a check in for decline process as previous research suggested many initial suspensions/declines for MMR were requested until the child's 2nd Birthday. This report gives the family time to consider their options and approach for vaccinations, prior to reminding the practice this patient may need manual review. It also serves as part of the replacement to the "Suspension Reports" and acts as further information for the Call/Recall Project

CSAIS Given Vaccines

For EMIS/Vision practices only; this is sent each morning if any vaccines for your patients were recorded in the previous 48 hours. This can include both those given the previous day and those patients who have now cleared data tracing for untraceable patients (ie; those patients with incorrect details matching to PDS). Any vaccine given by a non-practice entity is covered – though this is generally those vaccines given/recorded by the Community and School Aged Immunisation Service and their colleagues. This is intended to be recorded within the patient's EMIS record. If you have already received a Flu vaccine notification via NIVS you do not need to record this information from this report too.

Daily NBBS Results

For EMIS/Vision practices only; much like the CSAIS Given Vaccines report, this report gives you a daily update of any new babies receiving bloodspot/Guthrie testing the previous day – results are provided as they are received (so not all 10 tests may be sent together if an element is delayed; only those with results will send). This is specifically so that practices have insight into potential SCID (Severe Combined Immunodeficiency Disease) suspected or other conditions that may impact live

vaccine contraindications. Not all labs in the UK test for this currently, but trials are happening in labs bordering East of England.

Missing Primary Immunisation Report/Tasks

You may receive notifications from Child Health regarding missing immunisation history data, either via Task (SystemOne users) or Email reports (EMIS/Vision) – these are to ensure your COVER Data is accurate but also to avoid issues for movements in histories being incomplete and causing errors in scheduling for vaccines. A copy of the practice held vaccination history is all that is required in response to this enquiry. For SystemOne users you will be informed of what may be missing/incorrect in the patient's Vaccination Node of the clinical tree, with a request to adjust if possible (ie; missing doses, wrong dose numbers, duplicates etc).

COVER Monthly Dashboards

Sent out during the first full week of each month, these dashboards are a league table of your predicted COVER performance, if we were to submit the results for 6 months' time, today. It gives you a six month window to correct any errors you feel may be impacting performance for your practice should you choose to – and to see how you are performing amongst your peers in the ICB. At the bottom of the league table is a tailored list for any patients currently showing a 'fail flag' for that vaccine (MMR1, MMR2, Rota1, Rota2 or DTPP Booster). Patients with GPtoGP import issues, duplicates, refusals, early given vaccines or other issues may flag here. The Missing Primary report captures all children – this final list gives you those patients closest to breaching the national reporting as a more urgent action. Some patients may remain a legitimate fail flag (ie; refusals, early given vaccines). But it is provided as a courtesy to you to ensure you nationally submitted and publicly published data is as accurate as possible.

Clinic Scheduling Lists

Last but certainly not least – the routine weekly clinic lists give you indication of which patients have become eligible and sent letters that week to invite them for vaccination appointment. Those patients recalling following a DNA / Cancelled appointment are also recalled via this list. Depending on your set-up you may have slots that can be transcribed into your local ledgers, or a notification of those patients asked to phone in to book appointments (and what the system considers them due for). So long as you are a SystemOne user or EMIS/Vision using bulk return reporting options you do not need to return this report, it is just for your information.
